Class 3 Case Study: Customer Lifetime Value

Dr Wei Miao

UCL School of Management

October 11, 2023

Case Study: i-basket CLV

CLV for Marketing Decisions

Class objectives

- How to apply CLV calculation in a real-life case study for i-basket grocery chain
- Discuss and see examples of how CLV can be used by marketers to guide marketing decisions

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Section 1

Recap: Customer Lifetime Value

CLV for Marketing Decisions

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Customer Life Cycle

- We learned campaign-centric break-even analysis tools, such as **break-even quantity** and **net present value**. BEA is also referred to as cost-benefit analysis.
 - Costs of business activities
 - Benefits of business activities
- CLV is a customer-centric break-even analysis, which considers a customer as an asset to the company that generates future cashflows
 - Costs: customer acquisition costs (CAC)
 - Benefits: customer generates profits for the company in each period

CLV for Marketing Decisions

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Customer Acquisition Cost

- A new Bubble Tea shop in Canary Wharf is contemplating whether or not to attract new customers by sending ads leaflets to nearby residents.
 - $\bullet\,$ randomly sending out leaflets: expected response rate of $1\%\,$
 - using names purchased from a marketing agency: expected response rate of 4%
- A intuitive way of computing CAC: think about to obtain 1 new customer, how many offers to make; then multiply it with cost per offer

Case Study: i-basket CLV

CLV for Marketing Decisions

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

CLV: Formula

$$\mathrm{CLV} = -CAC + \sum_{t=1}^{N} \frac{CF_t * r^{(t-1)}}{(1+k)^t}$$

where $CF_t = M_t - c_t$

- r is the average per period retention rate; $r^{(t-1)}$ is the cumulative retention rate in period t
- ${\ensuremath{\, \bullet }}$ N is the number of periods over which the relationship is calculated
- M_t is the profit margin the customer generates in period t, which is typically $M_t = revenue * (1 COGS)$
- $\bullet \ c_t$ is the marketing costs per period to maintain customer relationship in each period t
- k is the interest (discount) rate for discounting future cash flows; $d=\frac{1}{1+k}$ is the discount factor

Overview for Computing CLV

Case Study: i-basket CLV

CLV for Marketing Decisions

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Step 1: Determine time unit of analysis

• Time unit of analysis

- [...] (find info in the case study)
 - When should we use monthly analysis or other units of time?

Case Study: i-basket CLV

CLV for Marketing Decisions

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Step 2: Determine number of years

- N: the number of years over which the customer relationship is assessed
 - [...] (find info in the case study)
 - How can you do better here?
- N <-

1

Case Study: i-basket CLV

CLV for Marketing Decisions

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

Step 3: Compute CF for each period

CF=M-c: gross profit each year, which is the profit from sales M minus marketing costs ${\bf c}$

 \bullet most customers paid the \$99 annual membership fee membership <-

Case Study: i-basket CLV

CLV for Marketing Decisions

Step 3: Compute CF for each period

• 40 times each year; each time \$100; with profit margin 7% (COGS 93%)

```
1 n_visit <-
2 revenue_each_visit <-
3 profit_margin <-
4 ## think carefully about how M is calculated, it's tricky ~~~~
5 M <-</pre>
```

- variable delivery costs each order:
 - [...] find info in the case study about delivery costs
 - Why classified as variable marketing costs? Does it make a difference?
- 1 deliverycost_each_visit <-</pre>

```
2 c <- deliverycost_each_visit * n_visit</pre>
```

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

Case Study: i-basket CLV

CLV for Marketing Decisions

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Step 3: Compute CF for each period

```
• The annual CF from customers CF

1  # CF is the cash flow for one year

2  CF <-

3

4  # create a sequence of CF for N years

5  profit_seq <- rep(CF,N)
```

Case Study: i-basket CLV

CLV for Marketing Decisions

▲ロト ▲周ト ▲ヨト ▲ヨト ヨー のくで

Step 4: Compute sequence of retention rate

```
I: retention rate
```

```
• [...] (find info in the case study)
```

```
1 # retention_rate is the probability of customer staying with us after 1 year
2 retention_rate <-</pre>
```

```
3
4
```

4 # create a geometric sequence of accumulative retention rate for N years 5 retention seq <-</p>

Case Study: i-basket CLV

CLV for Marketing Decisions

Step 5: Compute sequence of discount factors

```
It is a second the second the second test is a second test of the second test is a second test of the second test of test
```

```
• [...] A yearly discount rate of 10%
```

```
1 discount_rate <- 0.1
2 discount_factor_seq <-</pre>
```

- [...] The team decided to take a conservative approach whereby all profits are booked at the end of year.
 - All profits earned per customer in year 1 need to be discounted once, the profits earned in year 2 need to be discounted twice, and so on

Marketing Funnel for Paid Search Ads

Marketing Funnels

A marketing funnel is a model that represents the customer's journey from the initial awareness of a product or service to the ultimate action, often a purchase. This journey is depicted as a funnel to illustrate the decrease in the number of potential customers at each stage–Awareness, Interest, Consideration, Intent, Evaluation, and Purchase - each representing a different stage in the customer's journey toward transaction.

Case Study: i-basket CLV

CLV for Marketing Decisions

Step 6: Compute customer acquisition costs

CAC Part I: Costs of paid search ads to get 1 new member.

- [...] The click-through rates varied across these digital platforms, but hovered around 1-2%.
 - How to incorporate this information?
- [...] a fifth of those who clicked on an ad were willing to give the service a try
 - How many clickers do we need for 1 new "trier"?

```
1 # clicker_to_trier_rate is the % of trier customers from clickers
2 clicker_to_trier_rate <-</pre>
```

• [...] 20% of those that signed up for the free trial ended up becoming members

• How many triers do we need for1 new member?

- 1 # trier_to_member_rate is the % of a new member from triers
- 2 trier_to_member_rate <-</pre>

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Case Study: i-basket CLV

CLV for Marketing Decisions

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Step 6: Compute customer acquisition costs

```
• How many clickers do we need for 1 new member?
1 n_clickers_for_1newmember <- (1/clicker_to_trier_rate) * (1/trier_to_member_rate) # 5 * 5 *</pre>
```

• Finally, based on the the cost per click information, we can compute the total click costs to get 1 member.

```
1 total_cost_clicks <- 0.4 * n_clickers_for_1newmember # 0.4 * 25</pre>
```

Case Study: i-basket CLV

CLV for Marketing Decisions

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Step 6: Compute customer acquisition costs

CAC Part II: total costs of \$15 promo for first order each trier customer

```
• What is the total promo cost for these "trier" customers' first order?
1 promo_first_order_each_trier <- 15
2
3 total_cost_promo <- promo_first_order_each_trier * # promotion amount = $15
4 (1 - profit_margin) * # 7% profit margin
5 (1/trier_to_member_rate) # num of triers = 5</pre>
```

2

3

 CLV for Marketing Decisions

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Step 6: Compute customer acquisition costs

CAC Part III: total costs from selling groceries

```
• For each trier, 2 visits , the profits from the 2 visits are:
```

```
profit_each_trier <- revenue_each_visit * #$100 per visit</pre>
```

```
profit_margin * # 7% profit margin
```

- 2 # a trier shops twice
 - For each trier, the 2 visits are free of delivery charges, which are marketing costs to i-basket

```
1 deliverycost_1st <- 5 + (revenue_each_visit + promo_first_order_each_trier) * 0.035
2 deliverycost_2nd <- 5 + revenue_each_visit * 0.035
3 deliverycost_each_trier <- deliverycost_1st + deliverycost_2nd</pre>
```

• For each trier, compute net marketing costs from the 2 visits (marketing costs - earned profits)

```
netcost_each_trier <- deliverycost_each_trier - profit_each_trier</pre>
```

Total net profits from all 25 triers

```
1 totalcosts_from_all_triers <- netcost_each_trier * (1/trier_to_member_rate)</pre>
```

Case Study: i-basket CLV 0000000000000000000000 CLV for Marketing Decisions

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Step 6: Compute customer acquisition costs

 CAC = total costs for customer ad clicks (for all clickers) + total costs of \$15 promo (for all triers) + total costs of selling groceries (for all triers)
 CAC <- total_cost_clicks + total_cost_promo + totalcosts_from_all_triers

Case Study: i-basket CLV 0000000000000000000000 CLV for Marketing Decisions

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Step 7: Compute CLV

Ocompute the CLV based on the CLV formula (Table A)

• 7.1 Revenues, variables costs, and profit for the next 5 years

1 profit_seq

• 7.2 Apply retention rate
1 profit_seq_after_churn <- profit_seq *</pre>

• 7.3 Apply discount factor profit_seq_after_churn_discount<- profit_seq_after_churn *

• 7.4 Compute CLV by summing up future expected profits CLV <- sum(profit_seq_after_churn_discount) - CAC

User Defined Functions in R

A User Defined Function (UDF) in R refers to a function created by the user, as opposed to built-in functions, to perform specific operations or actions. UDFs are useful for automating and coding specific tasks that aren't covered by R's rich set of built-in functions, allowing the user to specify exactly what the function should do.

- **9** Function Name: The user decides the name of the function.
- **2** Function Body: Contains the code that performs the operation.
- **3** Arguments: (Optional) Values that can be passed into the function to influence its behavior.
- **§** Return Value: What the function outputs after it is called and executed.

Syntax of UDF

CLV for Marketing Decisions

```
1 function_name <- function(arg1, arg2, ...){
2     # Code to perform operations
3
4     return(output)
5 }</pre>
```

Case Study: i-basket CLV

CLV for Marketing Decisions

Use UDF to Compute CLV and Guide Marketing Decisions

- (To guide customer acquisition) What if the company only offers \$5 for first time purchase? This will save some CAC but the cliker-to-trier rate will decrease to 10%. Please compute the new CLV. Should you go ahead with the proposed change?
- (To guide customer retention) What if the company increases the annual membership fee to \$119? This will increase revenue from memberships but will also make some customers unhappy so their retention rate reduce to 60%. Please compute the new CLV. Should you go ahead with the proposed change? What if the retention rate reduces to 50%?
- (To conduct sensitivity analysis; after-class) Due to post-COVID economic recession, new members' spending is uncertain: there is a 60% chance of \$30 revenue per visit, 30% chance of \$40 revenue per visit, and 10% chance of \$50 revenue per visit. What would be the expected CLV for a new member customer?
