## **Causal Inference from OLS**

- From non-experimental secondary data, it is impossible to control all confounding factors, which means we can never obtain causal effects from OLS regressions.
- Is there still a way for us to obtain causal inference from secondary data?

Two-Stage Least Square

Application: Causal Effects of COVID-19

# What is an Instrumental Variable

#### Instrumental Variable

An instrumental variable is a set of variables Z that satisfies two requirements:

- **(**) z is exogeneous and uncorrelated with  $\epsilon$ ; that is,  $cov(Z, \epsilon) = 0$
- 2 affects x to some extent, that is,  $cov(Z, x) \neq 0$
- Point 1 is called **exogeneity** requirement (**exclusion restriction** requirement): the instrumental variable should be beyond individual's control, such that the instrumental variables are uncorrelated with any individual's unobserved confounding factors.
  - Potential IVs: government policy; natural disasters; randomized experiment; etc.
- Point 2 is called **relevance requirement**: though beyond an individual's control, the instrumental variable should still affect the individual's *X*, causing some exogenous changes in *X* that is beyond individual control.

# A Classic Example of Instrumental Variable

#### Return of Military Service to Lifetime Income<sup>1</sup>

 $Income = \beta_0 + \beta_1 Military Service + \epsilon$ 

- OLS suffers from endogeneity problems, for example
  - Individual ability/health correlates with military service and affects income
- A lottery was used to determine if soldiers with certain birthdays are drafted.
- The date of birth (z) is an instrumental variable
  - Affects years of military service:  $cov(z, x) \neq 0$
  - Randomly drawn and thus uncorrelated with any confounders:  $cov(z,\epsilon)=0$

### **IV Requirement I: Exogeneity**

- Exogeneity requires that z should only affect Y through X, but not directly affect Y.
- The instrumental variable should be beyond an individual's control. Because omitted variable bias is often caused by individual's own selection, instrumental variables are thus not correlated with any omitted variables.

Two-Stage Least Square

Application: Causal Effects of COVID-19

▲ロト ▲周ト ▲ヨト ▲ヨト ヨー のくで

### **IV Requirement II: Relevance**

- The instrumental variable must be sufficiently correlated with x.
- If the correlation between z and x is too small, we have a **weak IV** problem.
- For more mathematical details of the weak IV issue, refer to this resource.

### More Examples of IVs

#### Can you come up with IV candidates for the following causal questions?<sup>2</sup>

- COVID-19 cases => Uber Driver Supply
- $\bullet$  Number of restaurants on UberEat => Number of orders on UberEat
- Retail price => Sales

# Solving Endogeneity Using IV

• Given an endogenous OLS regression,

$$y_i = X_i\beta + \varepsilon_i, \quad \operatorname{cov}\left(X_i, \varepsilon_i\right) \neq 0$$

 $\bullet$  Find instrumental variables  $Z_i$  that do not (directly) influence  $y_i$  , but are correlated with  $X_i$

### Two-Stage Least Squares: Stage 1

- **()** Run a regression with X ~ Z. The predicted  $\hat{X}$  is predicted by Z, which should be uncorrelated with the error term  $\epsilon$ .
  - $\hat{X}$  (the part of changes in X due to Z) is exogenous, because Z is exogenous
  - All endogenous parts are now left over in the error term in the first-stage regression  $\epsilon_i$

$$X_i = Z_i \eta + \epsilon_i$$

Two-Stage Least Square

Application: Causal Effects of COVID-19

### Two-Stage Least Squares: Stage 2

**2** Run a regression with  $Y \sim \hat{X}$ : now  $\hat{X}$  is uncorrelated with the error term and thus we can get causal inference from the second stage regression.

$$y_i = \hat{X}\beta + \varepsilon_i, \quad \operatorname{cov}\left(\hat{X}_i, \varepsilon_i\right) = 0$$

# Causal Impact of COVID-19

- The COVID-19 pandemic has brought unprecedented disruptions to many industries, and platform businesses, especially sharing economy platforms, are among the most disrupted ones.
- How would you evaluate the causal impact of COVID-19 cases on the company's business and profits?
  - Can we collect data on the *COVID cases* and *sales* and run an OLS regression to get the causal effect? What would hinder us from causal inference from the above OLS regressions?

### Beyond the Impact of COVID-19 on Labor Supply

- You can follow this case study and propose similar topics for your term 3 dissertation project, depending on the company you work with.
- For similar causal inference interview questions/data science tasks, when RCTs are difficult to implement, instrumental variable method can be a very powerful solution.
